

AI AGENT VS AGENTIC AI

Defination

AI Agent

A single-task specialist

Receives one prompt, calls one or two tools, and returns an answer.

- ✓ Repetitive jobs with clear rules
- ✓ Speed and cost efficiency
- ✓ "Summarize this PDF and email me the bullet points"

Agentic AI System

A self-managing team of agents

Roles debate, plan, execute, criticize, and improve without further prompts.

- 🔄 Complex, changing projects
- 🧩 Branching plans, memory, and self-critique
- 🇮🇹 "Research ten competitors, draft a report, create slides, and flag data gaps"

AI Agent Maturity Levels

0

Direct Tool Call

No reasoning capability. Simple input-output operations with predefined responses.

Example: Calculator API, Weather lookup service

1

ReAct Loop - Single-step Helper

Basic reasoning with simple tool selection. Can choose appropriate tools but limited context.

Example: Chatbot that can search web OR check calendar, not both

2

Planner + Executor

Short-term memory with multi-step planning. Can break down tasks into sequences.

Example: Travel assistant that researches → books → confirms

3

Multi-Agent Crew

Role-based collaboration with critique capabilities. Different agents specialize in different tasks.

Example: Research team with analyst, writer, and fact-checker roles

4

Autonomous System

Long-term memory, self-healing plans, and continuous improvement without human intervention.

Example: Business intelligence system that adapts strategies based on market changes
